

Product Requirements Document: FOID (Fintech Open Identity)

1. Product Overview & Vision

FOID (Fintech Open Identity) is a portable, user-centric financial identity platform designed to revolutionize how individuals interact with fintech services, loan apps, and traditional banks. By allowing users to complete a rigorous KYC (Know Your Customer) process just once, FOID provides a reusable digital identity credential. Users can securely connect multiple bank accounts via Open Banking, centralize their financial data, and use a frictionless "Verify with FOID" single sign-on mechanism to authenticate themselves on third-party platforms.

Instead of administrative bloat, the FOID dashboard is explicitly centered around the user's financial identity, consent management, and daily interactions, augmented by advanced AI functionalities for bookkeeping and insights.

2. UI/UX Design Guidelines

The platform must project a modern, minimalist, enterprise-grade SaaS aesthetic, establishing high trust and usability.

- **Color Palette:** Monochromatic core layout (crisp whites, soft grays, deep blacks) with **purple** serving as the sole vibrant accent color for primary actions, active states, and highlights.
- **Visual Elements:** Generous whitespace, distinctly rounded cards (border-radius), and subtle, elegant drop shadows to establish depth.
- **Iconography:** Use **only Remix Icons** across the entire dashboard to ensure visual consistency.
- **Layout constraints:** Fixed left sidebar for navigation, top header for breadcrumbs/profile summary, and a main content area for dashboard widgets.

3. Page Architecture & Core Features

The dashboard is divided into 10 key navigational areas, each serving a distinct user need.

Page Name	Requirements & Features
Overview	High-level dashboard featuring KPI cards (Total Connected Banks, Identity Verification Status, Active Credentials, AI Credit Balance, Monthly Income/Expenses, Estimated Taxes). Must include clean line/bar charts for cash flow and a table for recent verification requests and activity.
My Identity	Displays the user's verified identity profile, verification progress tracker, active credential status, FOID Trust Score, linked accounts, and the generated FOID Verification Code / QR Code for instant scanning.
Connected Bank Accounts	Management center for Open Banking connections. Supports linking and syncing with institutions like GTBank, Access Bank, Zenith, UBA, Moniepoint, Opay, Kuda, and others.
Verification Credentials	A repository of the user's active digital credentials, showing validity periods, usage history, and revocation options.
Consent Requests	A privacy control center displaying incoming data access requests from third-party organizations. Highlights what specific data is requested, current status, and provides 1-click "Approve" or "Deny" actions.
Business Ledger	AI-powered automated accounting. Users

Page Name	Requirements & Features
	upload/snap receipts and invoices. The AI extracts data, categorizes transactions, generates professional accounting tables, tracks cash flow, estimates taxes, and allows conversational queries regarding bookkeeping.
Ledger History	Archive of all AI-generated ledgers. Fully searchable, editable, and exportable (PDF/CSV). Organized dynamically by month or business entity.
AI Credit Wallet	Replaces traditional SaaS subscriptions. Displays current AI Credit balance, historical usage breakdown, top-up/purchase options, and remaining credits.
Reports & Insights	Deep-dive analytics on financial health, spending behaviors, identity usage frequency, and comprehensive tax summaries.
Profile & Settings	User account configurations, security settings (MFA, password updates), notification preferences, and UI theme toggles (if applicable).

4. AI Integrations

AI is a foundational pillar of the FOID experience, heavily integrated into financial management and user navigation.

- **Floating AI Assistant:** A persistent, floating chat button (similar to Intercom/Tidio) anchored to the bottom-right corner of every page. It acts as the primary interaction layer,

allowing users to analyze finances, ask bookkeeping questions, navigate features, and generate reports conversationally.

- **AI Credits System:** Premium AI features (ledger generation, document extraction, advanced insights) consume AI credits. The platform must implement a ledger deduction system that prompts users gracefully when credits run low.
- **OCR & Data Extraction:** Backend integration to process uploaded receipts/invoices, extracting line items, dates, vendor names, and amounts with high accuracy to auto-populate the Business Ledger.

Deliverables: A complete, zipped repository of the static assets matching the exact structure and visual fidelity described, ready for backend integration by the engineering team.
